

# welcome

TO THE WORLD OF

# ***BEARINGS***

# What is a Bearing??????

---

A bearing is a machine element which reduces friction between two members, having relative motion with respect to each other.

# Purpose of Bearing??????

---

- To provide rigidity to the shaft in axial and radial direction.
- To reduce friction and wear out of components, which are having relative motion. Thereby, reducing the heat and sound generated.
- To carry loads at considerable speeds

# Bearing Geometry

# Types of bearings

---

- Sliding Contact Bearings or Frictional Bearings
- Rolling Contact Bearings or Anti-Friction Bearings

# Rolling Contact Bearings

---

Ball Bearings

Roller Bearings

## BALL BEARINGS

Deep groove ball bearings

Self aligning ball bearings

Angular contact ball  
bearing

Thrust ball bearings

## ROLLER BEARINGS

Cylindrical roller bearings

Spherical roller bearings

Taper roller bearings

Needle roller bearings

# FRICTIONAL BEARINGS

ARE OF TWO TYPES

## 1. BUSH BEARINGS

## 2. SLIDE OR SLEEVE BEARINGS (ex. Journal bearing)

# FEATURES OF JOURNAL BEARINGS

---

- JOURNAL BEARINGS ARE OF HYDRO DYNAMIC FILM OPERATED TYPE
- THESE ARE HIGH CAPACITY LOAD BEARING TYPE
- THERE IS NO CONTACT BETWEEN MOVING & NON MOVING ELEMENTS
- USES BABBIT METAL AS BEARING MATERIAL

# Types of Bearings

Single-row  
Radial Ball

Radial Roller

Angular  
Contact Ball

Angular  
Roller

# Types of Bearings

Spherical  
Roller

Tapered Roller

Needle  
roller

Thrust Roller

# BEARING LIFE

---

Life of a bearing is defined as the number of revolutions which the bearing is capable of enduring before the first sign of fatigue (flaking, spalling and crack) occurs on one of its ring or rolling element

# Bearing Rated Life

Test (fatigue) data

Radial Load (lbs)

$L_{10}$  Life (cycles)

*Empirical relationship:*

$$\frac{L_2}{L_1} = \left( \frac{P_1}{P_2} \right)^k$$

•  $k=3.0$  (ball)

•  $k=3.33$  (roller)

$P_1$  = Basic dynamic rated load, N

$P_2$  = Equivalent dynamic load, N

# Bearing Selection

---

- Determine the design life (in cycles)
- Determine the design load

$$P_d = V R$$

V=1 for inner race rotation

V=1.2 for outer race rotation

- Calculate the required basic dynamic load

$$C_{req'd} = P_d \left( \frac{L_d}{10^6} \right)^{\frac{1}{k}}$$

- Select a bearing with ( $C > C_{req'd}$ ) and a bore that closely matches the shaft diameter.

# Bearing Operation

## Boundary Lubrication

The oil fills in the volume in the troughs on the mating parts. There is extensive metal-to-metal contact of the peaks and a high rate of friction and wear.

# Bearing Operation

## Full-film Lubrication

As the shaft rotates, the oil sticks to the surface of the shaft and a thin film is established between the bearing and the rotating shaft. There is no metal-to-metal contact and the shaft appears to float above the bearing.

# Hydrodynamic Lubrication

## Full-film lubrication

- > Higher speeds
- > Higher viscosity
- > Lower loads

# Bearing Lubrication

---

## The Functions of Lubrication

- Lubricants reduce wear and friction by
  - Lubricating all true rolling contacts elastohydrodynamically
  - Lubricating sliding contacts between the raceways and rolling elements
  - Lubricating sliding contact between the rollers and guiding elements

# The Functions of Lubrication

---

- Lubricants also
  - Protect highly finished surfaces of rolling elements and rings from corrosion
  - Help prevent intrusion of foreign matter, (done with grease pack)
  - Provide a heat transfer medium

# Lubricant Selection

Oil or Grease ?

# Lubricant Selection

## Oil or Grease ?

**Grease:**

**Oil:**

+ Simple installation (**cheap!**)

+ Additional bearing **protection**  
(against dirt, moisture)

+ Additional **cooling**

+ **Filtering** and quality  
control possible

80% of all bearings are grease lubricated

# Lubricant Selection

## Base Oil viscosity

VISCOSITY = "resistance to flow" of a fluid

Water: low viscosity  
(1cSt at 20°C)

Honey: high viscosity  
(~1200 cSt at 20°C)

# Lubricant Selection

## Base Oil viscosity

**low viscosity:**

+ low friction  
- thin oil film

**high viscosity:**

+ thick oil film  
- high friction

**Finding the right balance**

base oil viscosity changes with **temperature !**  
(like with honey)

# Lubricant Selection

## Definition of Grease

**A grease is 90 % oil held in a thickener (10 %)**

**Think of the thickener as a sponge holding the oil**

**It is not: – a thick oil  
– a solid oil (wax)**

# Lubricant Selection

## *What's inside a grease?*

Grease = Base oil + Thickener + Additives  
(70-95 %) (5-30 %)

# How do Bearings Fail?

**Not always due to Natural Causes**

**Only**

**34 %**

**of bearings fail  
due to Fatigue,  
which is the basis  
of life calculation.**

# How do Bearings Fail?

## Poor Lubrication

is the reason for

**36 %**

of premature  
bearing failures

# How do Bearings Fail?

## Contamination

is the reason for

**14 %**

of premature

bearing failures

# How do Bearings Fail?

## Poor Installation

is the reason for

**16 %**

of premature

bearing failures

# Bearing Failures & Their Causes

---

*Unusual operating behaviour  
indicating damage : Subjective damage  
recognition*

*In the vast majority of bearing  
applications it is sufficient when  
machine operators watch out for uneven  
running or unusual noise in the bearing  
system*

# *Bearing Failures & Their Causes*

*Unusual operating behaviour indicating  
damage : Subjective damage recognition*

# DOs & DON'Ts with Bearings

---

## DO s

- .Keep the bearings in protective packing till they are mounted.
- .Cover the assembled bearings appropriately to avoid dust ingress.
- .Store the bearings in dry area.
- .Use tubes, Pullet, Hydraulic nuts, and other tools for removal / fixing of the bearings.
- .Use correct amount of specified lubrication at right time in correct procedure.

# DOs & DON'Ts with Bearings

---

## DO's

- Prevent the penetration of external contaminants into the bearings.
- Maintain the fits between the bearings with mating shaft / housing.
- Align the members properly to avoid unnecessary load on the bearings.
- Check the operating condition of the bearings by feeling the noise, temperature and sensing vibration through touch.
- Fill the bearings with right grease while assembling.

# DOs & DON'Ts with Bearings

---

## Dont's

- Over lubrication is a silent killer for bearings. Do not over lubricate.
- Never allow welding at bearings that will damage the contact surfaces.
- Do not apply direct blows on the bearing while mounting / dismantling.
- Do not keep the bearings in a dusty area.
- Don't let the bearing stand upright, store them flat on their sides.

# DOs & DON'Ts with Bearings

---

## Dont's

- Do not allow water to enter the bearings / lubricant.
- Do not use water to clean the bearings.
